**Abstract:** The mechanisms that outline how foodstuff from a field wind up on our tables are referred to as a food supply chain or food system. The new food products necessitate higher quality and safety and a more tightly managed distribution. This study describes the food supply chain in a critical context to emphasize the risks and concerns with traceability. The research extends ideas on essential control points in food supply chains to a crucial perspective. This document explains how India's food distribution system works, from manufacturer to end-user.
